

White Out

Exxon, trying to get ahead of climate change, sent two geologists to northern Greenland to see if they could find any interesting features that might warrant future attention. For a week, all they saw was unrelenting white in all directions. Then Brad noticed something in the distance.

“Jason, look at that black smudge over there.” He handed him the binoculars. “It looks like a coal outcropping, and you know that that means!”

Jason peered briefly through the binoculars and responded, “It means we have to get closer.”

“OK,” said Brad. “But you’ll see I’m right”.

A half hour later, they had reached the curious black blob, and it became apparent that they had discovered six dark wolf pups bundled together under a rock, trying to keep warm. Jason couldn’t resist jabbing the needle, saying “Brad, you have to learn that arctic litters is not coal”.
